Private / Public Key authorization	Special scripting (COM support)	Flexible scheduler	Files filtering
Files encryption	Unlimited Backup Sets	Programs/process conjunction	Files compression
User Interface Password protection	Custom builds	Notification service	Registry Backup

I. Security

1. Secure protocols support

Leo Backup supports the secure backup on SFTP and FTP SSL/TLS servers allowing you to avoid any data intercepting.

The using of the cryptographic protected file transfer protocols SFTP and FTP SSL/TLS is complete and reliable solution for the data interception problem: both protocols encrypt the passwords and files before transferring, guaranteeing your files totally intact.

2. Private / Public Key authorization

Authorization by these keys provides the high security level within your company' employees access by generating certain restrictions. These methods allow the data backup requests only after the credentials checking, letting you protect your network and be assure in its strength.

3. Files encryption

Leo Backup uses Blowfish encryption to ensure that no one but you could access your data. Blowfish method takes a variable-length password key from 4 to 56 characters in length, making it ideal for both home and corporate use.

4. User Interface Password protection

Set your password on the program launch and no one except you would be able to manage the backup data and its locations.

II. Corporate usage

1. Active Directory impersonation

You can manage the backup cooperation thought the domains systems: our program provides you with flexible arrangement of the company accounts credentials.

2. Special scripting (COM support)

You can adjust the program functionality to the particular company policy. It's an useful interactivity with the software accordingly to your company rules.

3. Unlimited Backup Sets

You can create and manage any amount of backup sets. The program has no limitation with data maintenance, so you can easily categorize your files properly and create as many sets as you need to.

4. Custom versions

We provide customized builds of Leo Backup branded for specific companies' requirements at the special price. We consider all types of customization from minor logo changes to new features implementation.

III. Automatic backup

1. Service mode support

Leo Backup can work as a system application. The benefit is that your backup job is processed even if other user connects the system at that moment or when nobody is logged. This is particularly suitable for your scheduled tasks to be executed even when you are offline and for backing up the stand alone servers also.

2. Flexible scheduler

In order to avoid the unexpected but possible failure it is indispensable to apply the scheduled backup. You can define the proper plan and run backup and restoring automatically. Just set the program and Leo Backup will perform it accordingly.

3. Program/process conjunction

Combine your backup process with your commonly used programs functionality. You can specify the proper executable file and then program will be launched according to the backup running: before or after it. Besides that, both options are available under System account or User's one.

4. Reporting service

You are always notified of the backup results by e-mail message. Moreover, you can receive the detailed log about performed operation

IV. Special Backup Management

1. Timestamps

You can automatically mark the particular folder of your backed up files: it will help you to avoid the large data accumulation due to frequent backup and tangled assortment of files and folders. Additionally, mark your backup with proper custom notice.

2. Compression

To preserve your storage space you can apply the ZIP compression for your backups. There are few compression options – single ZIP, each file zipping and "ZIP each folder" mode – so you can organize backup files structure in the most convenient way. Since we use the common ZIP technology you can restore the backed up files manually, using any zip-compatible utility.

3. Files filtering

To make your backup faster and clearer just apply the Filter option: all marked file-types will be excluded from your kit. If you need to add just some particular data in your backup job, mark its types and Leo Backup will perform the rest.

4. Registry Backup

The registry stores the data in a structured hierarchy of keys, subkeys and named values. Incorrectly editing the registry may severely damage your system. Leo Backup gives you the one-click option to reliably back up your Registry files.
